**Florida Reef Tract
Coral Disease Outbreak:
Status and Response Efforts**

12/12/2017

First Warning Signs in 2014

Diploria labyrinthiformis

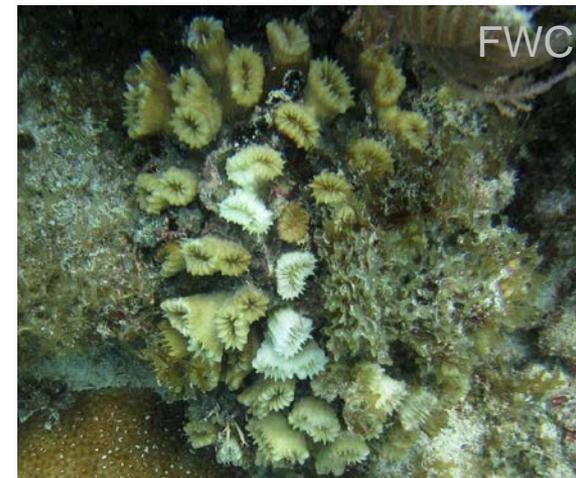

Pseudodiploria strigosa

Dichocoenia stokesii

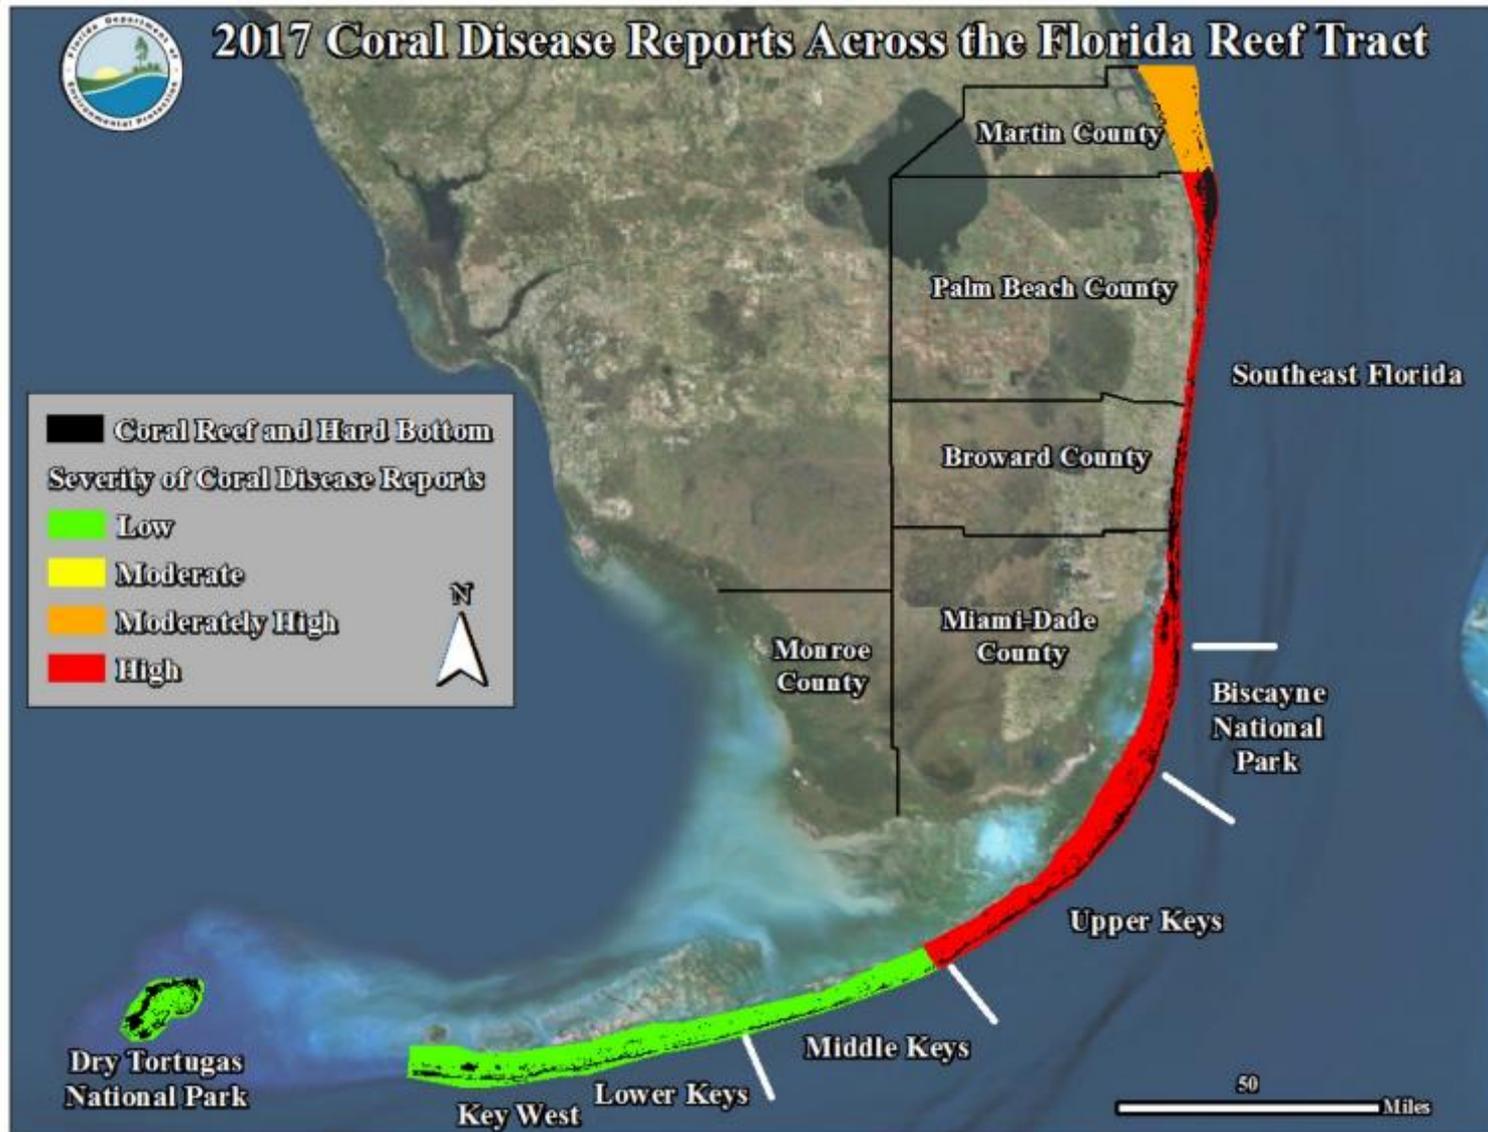

Meandrina Meandrites

Eusmilia fastigiata

Disease Progression

Background Coral Disease

Endemic
Disease
Prevalence:
2-3%

Current Disease Outbreak

At some sites
>25%
of the entire
coral
population is
affected

Current Disease Outbreak

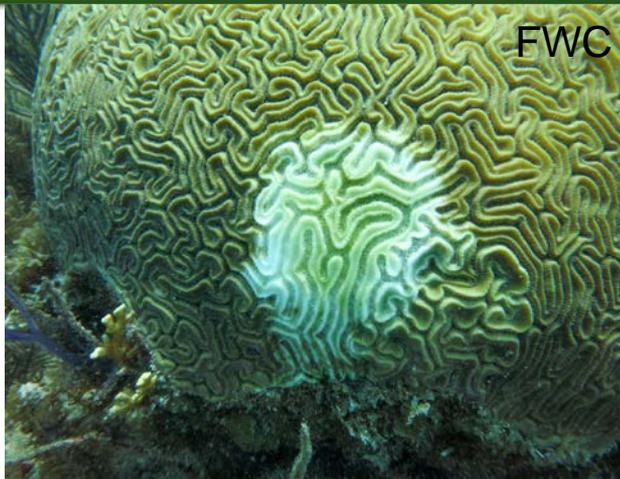

Species
Specific
Disease
Prevalence:
66-100%

Disease Prevalence

Hens & Chickens: 28%

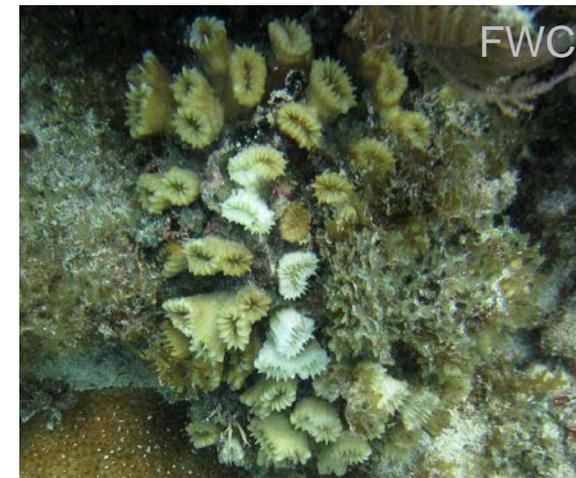

Hens & Chickens: 66%

Hens & Chickens: 33%

Hens & Chickens: 100%

Hens & Chickens: N/A

Whole Colony Mortality Rates

Grecian Rocks: 66%

Grecian Rocks: 100%

Grecian Rocks: 92%

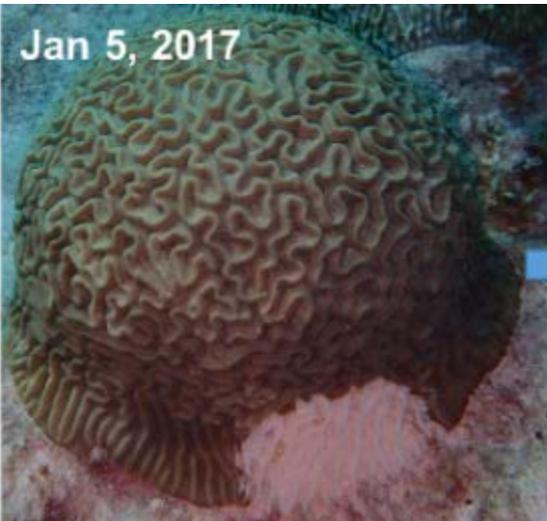

Grecian Rocks: 100%

Grecian Rocks: 66%

Rapid Disease Progression

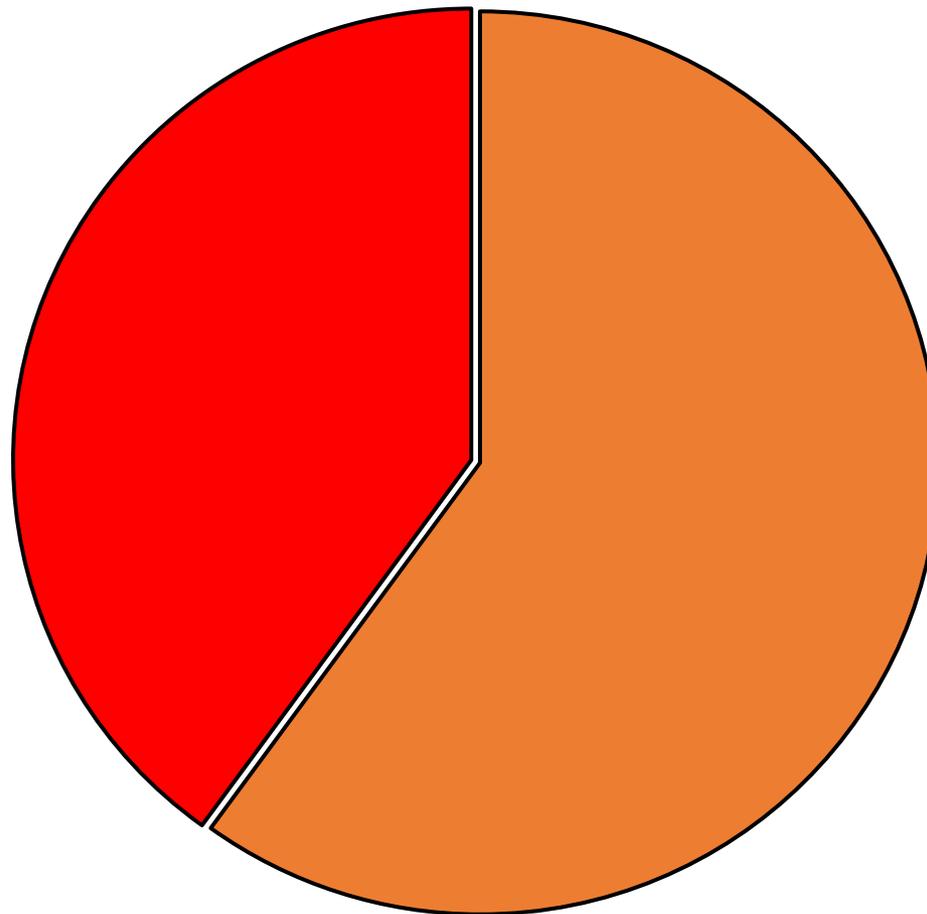

Coral Susceptibility to Outbreak

**Nearly 50% of the species along the Florida Reef Tract
have been affected during this outbreak**

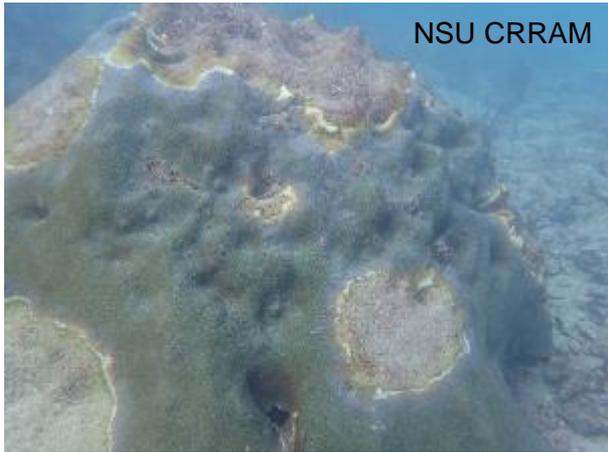

Species
confirmed
with tissue
lesions

Unaffected
species to
date

Impact to Primary Reef Builders

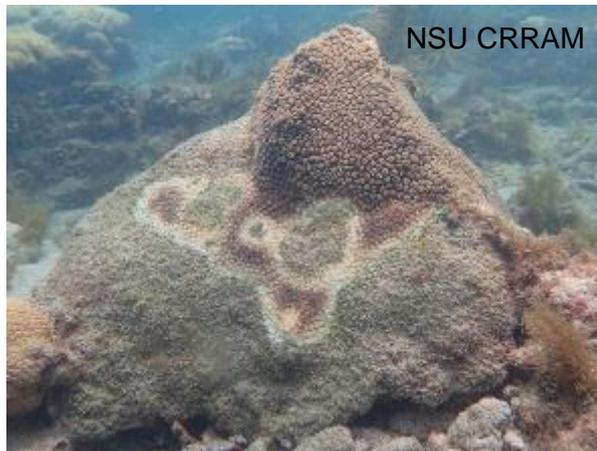

Orbicella faveolata

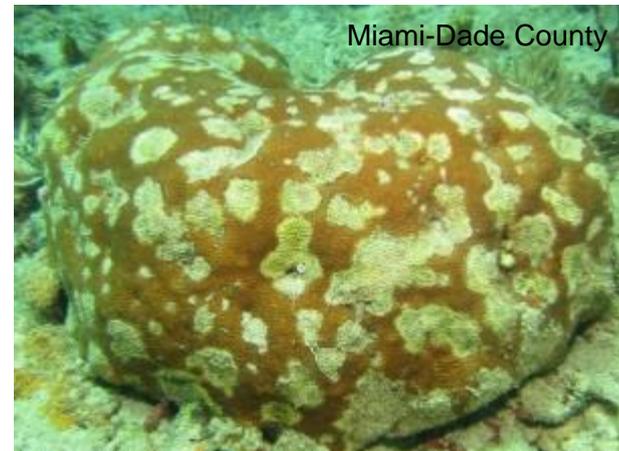

Orbicella annularis

Colpophyllia natans

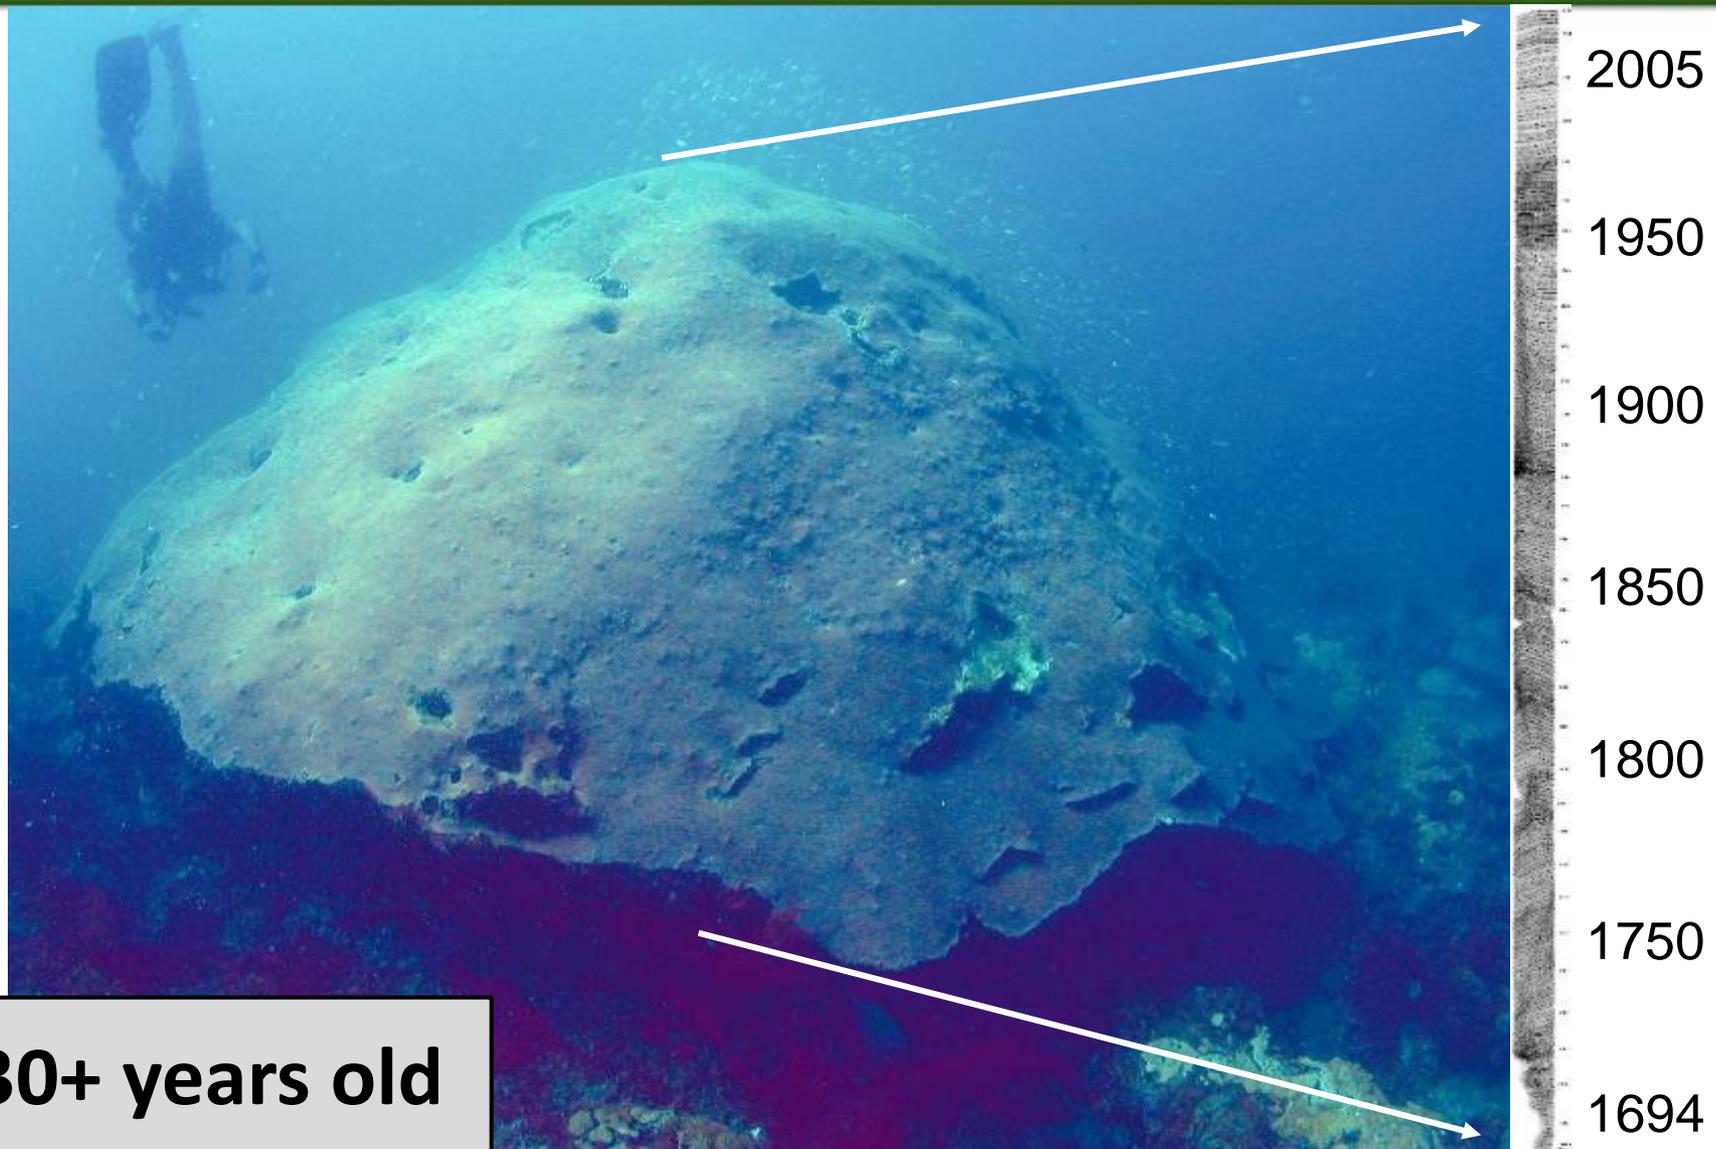

Montastraea cavernosa

Siderastrea siderea

Oldest Living Corals

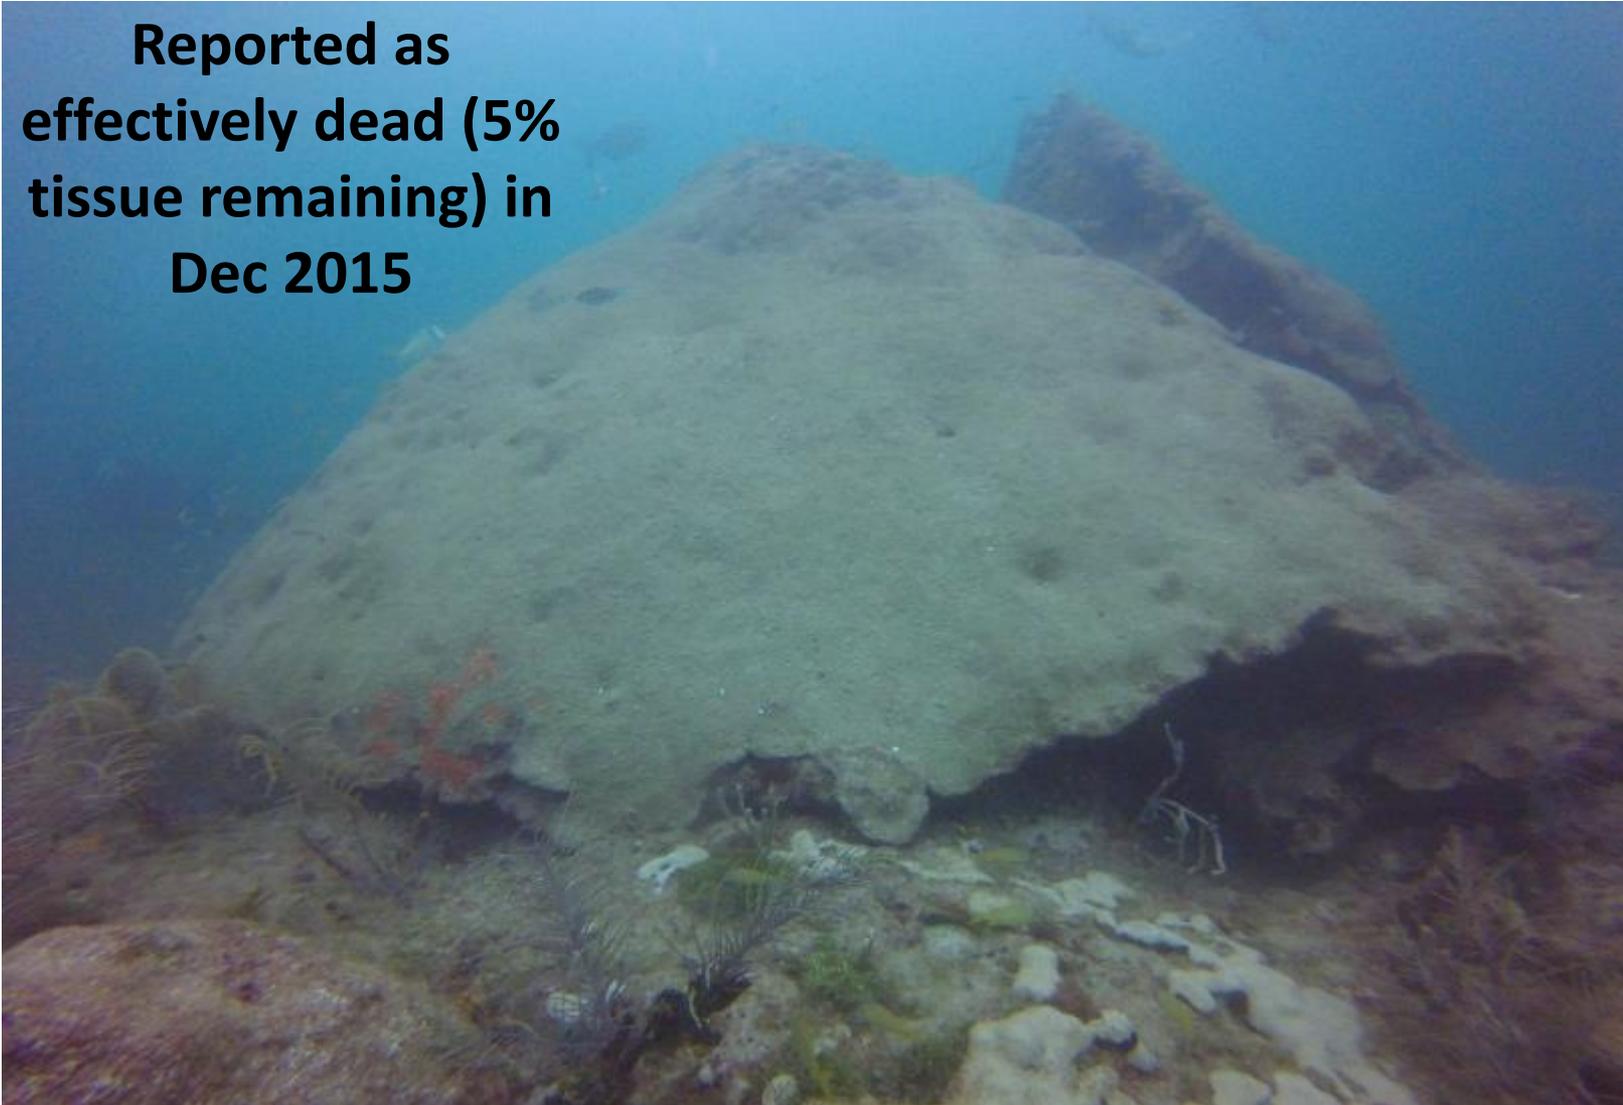

330+ years old

Oldest living corals

**Reported as
effectively dead (5%
tissue remaining) in
Dec 2015**

Economic and Ecological Significance

New time or place

Greater frequency

Species of concern

Unidentified lesions

UNPRECEDENTED EVENT

1. **Tenure of the disease outbreak.** After 3 years, it is still active in on some species in SEFL. Actively starting on many reefs in the FL Keys with most vulnerable species
2. **The # of coral species affected.** This outbreak has impacted nearly half the species in FL. Documented on all the primary/massive reef builders along the FL reef tract
3. **Spatial scale.** It has now encompassed half of the Florida Reef Tract
4. **The incredibly high frequency of whole colony mortality.** If a colony becomes infected it will likely suffer 100% mortality
5. **Reduction in coral population structure.** The loss of massive, framework building species will disproportionately contribute to a loss of coral cover.
6. **The ramifications for FL:** FL depends on healthy reef ecosystems for economic vitality, loss of ecosystem services could be catastrophic. Recovery will require hundreds of years!

Response Efforts

Response Efforts

Data Collection

Document the distribution, prevalence, severity and impacts associated with the disease outbreak.

- Reef tract-wide monitoring programs

Coral Reef Evaluation and Monitoring Projects

Response Efforts

Data Collection

Document the distribution, prevalence, severity and impacts associated with the disease outbreak.

- Targeted coral disease surveys

Large Coral Assessment

We're All Connected ~ Keep It Protected

Response Efforts

**Sampling,
Analysis &
Experimentation**

Identify potential pathogens and characterize the disease(s).

- Coral tissue sample collection

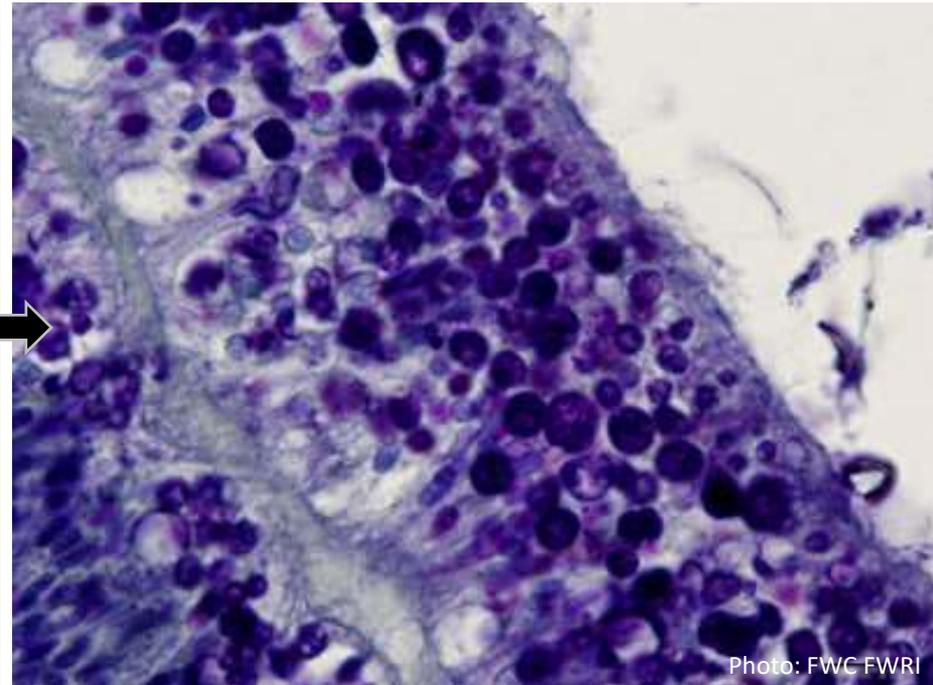

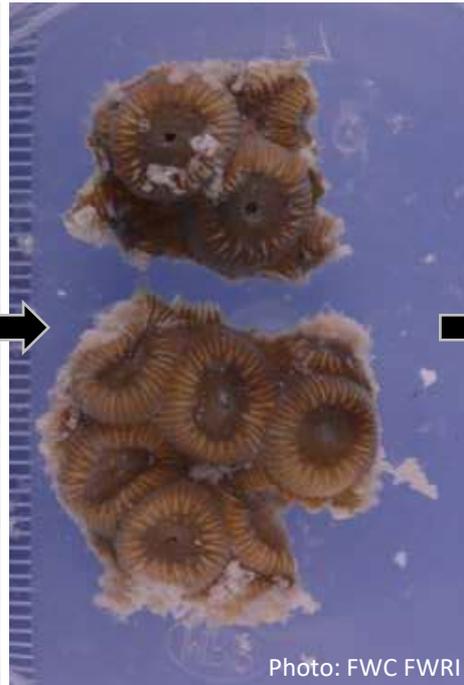

Response Efforts

**Sampling,
Analysis &
Experimentation**

Identify potential pathogens and characterize the disease(s).

- Laboratory analysis

Response Efforts

July 1, 2017

Sampling,
Analysis &
Experimentation

Identify potential pathogens and characterize the disease(s).

- Laboratory transmission experiments

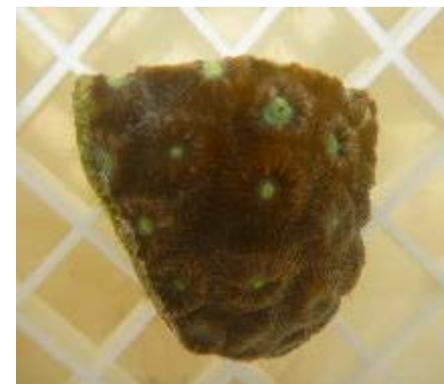

Diseased

Touching

Non-touching

Response Efforts

Understand
Environmental
Conditions

Understand if changes in environmental conditions may have caused or contributed to the outbreak.

Why did this coral disease outbreak happen when it did?

Response Efforts

Funding & Capacity

Seek additional funding and capacity to support more comprehensive response efforts.

Thanks to the Florida Legislature and Governor Scott, FCO Southeast Region received \$1 Million in FY17 to support Florida's coral reefs:

Priority Coral Disease Response

- Coral Disease Investigation Training
- Strategic Sampling & Laboratory Analysis
- Coral Disease Surveys & Fixed Site Monitoring
- Data Management and Epidemiological Analysis
- Sampling Plan and Disease Intervention Workshops

What's Next?

Continue coral disease investigation.

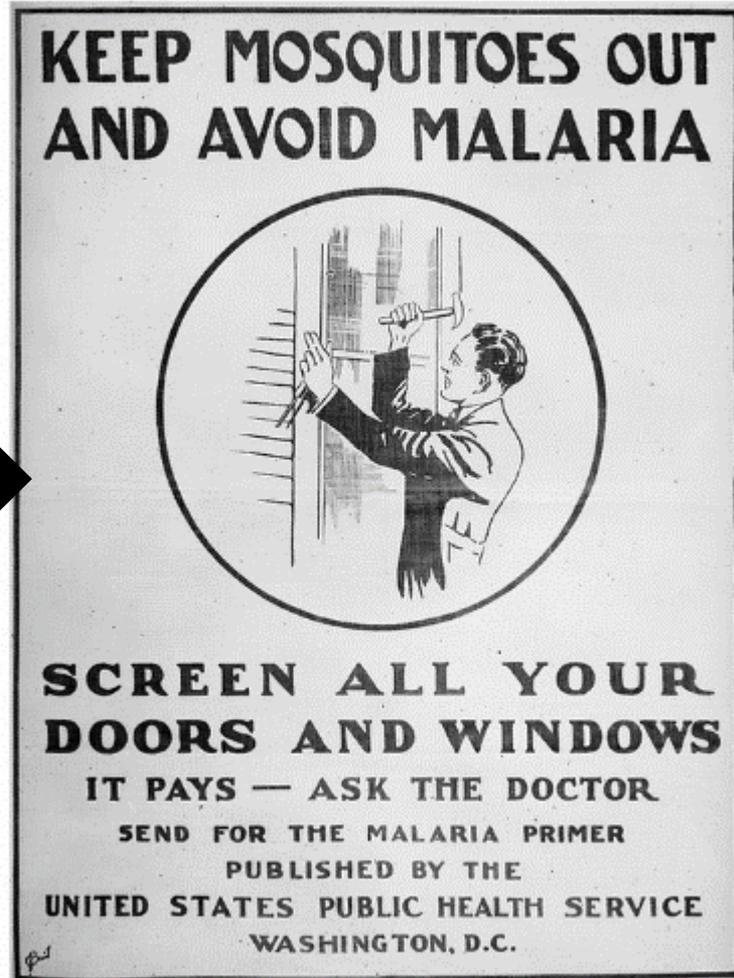

What's Next?

Continue coral disease investigation.

Anopheles mosquito
(most common carrier of malaria)

What's Next?

Implement management interventions.

Laboratory studies

Small-scale field trials

Larger-scale field application

Photos: NSU CRRAM

What's Next?

Continue coordinating with partners.

What's Next?

Control what we can: Address underlying environmental conditions.

Thank You!
